

PROCEDURE FOR HEATING ELEMENT REPLACEMENT

The towel rail must be installed in an UPRIGHT position with the element located at the bottom. Jeeves Heated Towel Rails strongly advise that a qualified electrician installs the rail in compliance with the Current Local Electrical Regulations.

As the thermal fluid level in the towel rail is critical for both safety and correct heating, the following procedure must be followed when replacing the thermostatic heating element.

After removing the rail from the wall and turning it upside down, remove (by pulling) the element cover piece from the vertical tube of the rail (the electrical cable will be visible from the cover piece).

Place the rail on a flat surface (work bench) and with a wrench slightly loosen the element.

Stand the rail vertically and remove the element ensuring that no thermal fluid is lost.

The replacement element can now be screwed in by hand before being fully tightened with a wrench.

Visually check the base of the element for any evidence of the 'O' ring not being seated correctly. Should any part of the 'O' ring be visible, it would need to be replaced as this could lead to a potential leak.

Switch the electrical power on and test the rail for a minimum of two hours. Check for leaks as well as consistent heating.
